RareBooksClub. Paperback. Book Condition: New. Paperback. 18 pages. OCLC Number: 51783009 Excerpt: . . . We used the Sack TCP as indicated in RFC2018 ( ref. 6 ) in our simulation. All wireless and TCP parameters 1 were set to ns default values except for the TCP packet size, the receivers window, and the transmitted and received gain of the antenna. We set the TCP packet size to 512 bytes and the advertisement window to 5000 packets so that it was not a limiting factor in transfers. The 36-Mbps satellite channel could not be utilized fully because IEEE802. 11 link model used in the wireless domain was limited to 2-Mbps bandwidth, effectively limiting our satellite bandwidths to 2 Mbps. The transmitted and received antenna gains were set to 40. 0, making the nominal range of the MN, HA, and FAs 1581 m. The destination-sequence distance-vector ( DSDV ) routing protocol ( ref. 7 ) was used to route packets between the MN, HA, and FAs. Fifty seconds into the simulation the MN started to move away from the HA at 200 m s. The MN paused for 20 s in the range of FA1 and for 40 s in the range of FA2 before it stopped in the range of FA3. The TCP source also started to send 512-byte packets by file transfer protocol ( FTP ) to the MN 50 s into the simulation ( as soon as the MN started moving ). ASSUMPTIONS For wired links we assumed a BER of zero and no congestion. For the VDL terminal connections we assumed - 4 - 5 an 8-kbps data rate and error rates of either 10 or 10, typical for VDL channels. For the satellite connections we - 8 assumed either a near-error-free, high-rate channel ( 2 Mbps...
